BOUGUER GRAVITY ATLAS OF TEXAS, PLAINVIEW SHEET

Compiled by: G. R. Keller and C. L. V. Aiken
Assisted by: M. R. Voight and Wayne Basden

1986

Cartography by John T. Ames under the supervision of R. L. Dillon.

TRANSVERSE MERCATOR PROJECTION

1985 MAGNETIC DECLINATION FOR CENTER OF THIS SHEET IS 4°47' EAST MEAN ANNUAL CHANGE IS 4°6' WESTWARD

CONTOUR INTERVAL = 2 MILLIGALPS

TEXAS GRAVITY DATA BASE AND REDUCTION PARAMETERS

The data base of gravity readings that made the Texas gravity mapping project possible is the result of the efforts of many individuals and groups; ultimately it will contain more than 50,000 readings. Major sources of data for each sheet are indicated in the explanation. However, a particular note of thanks is due to Mr. and Mrs. Hart Brown because their remarkable collection of data was the major source of data for this project. Without these data, the mapping and compilation required would have been impossible.

Data in the Texas gravity data base are carefully edited and maintained in a standard format and are tied to a common gravity datum (IGSN-71; Morelli, 1976). Sea level was used as an elevation datum, and a density of 2.67 g/cm³ was used in the Bouguer correction. Corrections west of the 100°W longitude line for terrain corrections were calculated in zones extending from 0.89 km to 167 km from each station (Hammer, 1939). These calculations employed a terrain correction program written by Ploof (1977) and a set of averaged elevations on a grid interval of 30 seconds of latitude and longitude. Thus, the data base is internally consistent, and the resulting maps all tie together at common boundaries. These maps were constructed by gridding the data using the minimum curvature technique (Briggs, 1974) and contoured by using a modified version of the Surface II graphics system (Sampson, 1978).

All gravity data were reduced to Bouguer anomaly values using the following formulas:

$$BA = Goss - G_{TH} + Cr_A + (Ce_{OU} + Ce_{ER} + Ce_{UV})\rho$$

where

C_{BA} = Bouguer anomaly

ρ' = Ratio of reduction density to the standard value of 2.67 g/cm³
 G_{oss} = Observed gravity, in milligals, relative to the IGSN-71 gravity datum (Morelli, 1976)

G_{TH} = Theoretical gravity on the surface (sea level) of the 1967 reference spheroid, $= 978031.843 + \sigma (\pm 15727.66 - \sigma (-15762.337 + \sigma (69.43)))$, $\sigma = 0.0001 \text{ } \mu\text{Gal}$; ϕ = latitude in degrees (International Association of Geodesy, 1967; see Morelli, 1976).

Cr_A = Free air correction for the elevation of the station relative to sea level, $= (0.30877 + \sigma (-0.0013398 + \sigma (0.0013553 + \sigma (-0.0005329 + \sigma (0.0009911)))) - h (0.072 \times 10^{-6})$, h = elevation of station in meters

Ce_{OU} = Bouguer correction for mass positioned between the station and sea bottom. Correction is calculated from the formula for the attraction of an infinite horizontal slab of thickness h and density ρ to obtain the equation $G_{ce} = -0.19h$

Ce_{UV} = Curvature correction, a modification of the Bouguer slab approximation that corrects for the curvature of the Earth's surface, $= -h (1.4639108 \times 10^{-3} + h (-3.532715 \times 10^{-7} + h (4.449648 \times 10^{-11}))$

C_{ER} = Correction for local topography
